

1 Perturb cells

A pooled CRISPR library gives each cell a guide RNA.

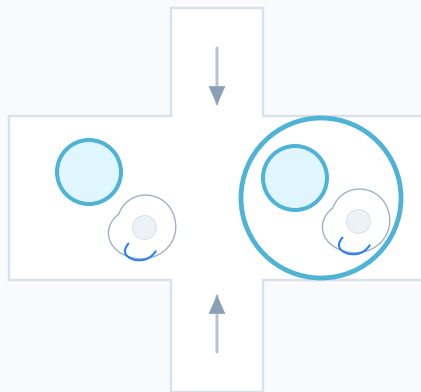

Known input

which guide each cell received

2 Capture cells

Single-cell RNA-seq puts one cell and one bead in a droplet.

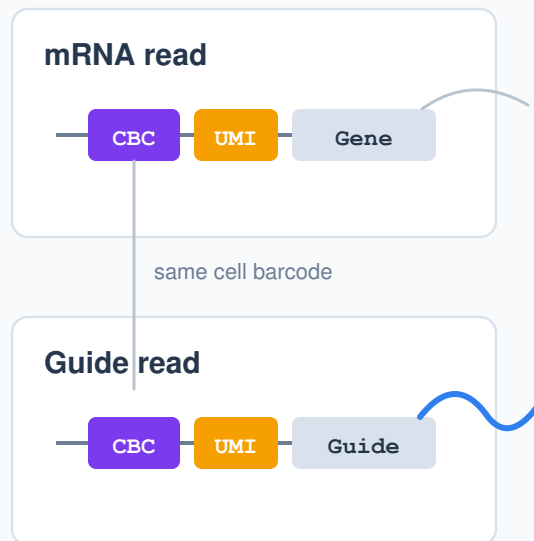

Shared barcode

marks all molecules from that cell

3 Read two signals

The same cell barcode links guide identity and expression.

4 Build matrix

Each row is one cell:
guide plus gene expression.

Cell	Guide	Genes
C1	A	
C2	B	
C3	NT	
...		

Analysis-ready

perturbation effect per cell
